!!!!!!!	•

#### Penn Treebank POS Tags

1. CC	Coordinating conjunction	25. TO	to
2. CD	Cardinal number	26. UH	Interjection
3. DT	Determiner	27. VB	Verb, base form
4. EX	Existential there	28. VBD	Verb, past tense
5. FW	Foreign word	29. VBG	Verb, gerund/present
6. IN	Preposition/subordinating		participle
	conjunction	30. VBN	Verb, past participle
7. JJ	Adjective	31. VBP	Verb, non-3rd ps. sing. present
8. JJR	Adjective, comparative	32. VBZ	Verb, 3rd ps. sing. present
9. jjs	Adjective, superlative	33. WDT	wh-determiner
10. LS	List item marker	34. WP	wh-pronoun
11. MD	Modal	35. WP\$	Possessive wh-pronoun
12. NN	Noun, singular or mass	36. WRB	wh-adverb
13. NNS	Noun, plural	37. #	Pound sign
14. NNP	Proper noun, singular	38. \$	Dollar sign
15. NNPS	Proper noun, plural	39	Sentence-final punctuation
16. PDT	Predeterminer	40. ,	Comma
17. POS	Possessive ending	41. :	Colon, semi-colon
18. PRP	Personal pronoun	42. (	Left bracket character
19. PP\$	Possessive pronoun	43. )	Right bracket character
20. RB	Adverb	44. "	Straight double quote
21. RBR	Adverb, comparative	45. ′	Left open single quote
22. RBS	Adverb, superlative	46. "	Left open double quote
23. RP	Particle	47. ′	Right close single quote
24. SYM	Symbol (mathematical or scientific)	48. "	Right close double quote
24. UIIVI	Symbol (mathematical of scientific)	70.	ragin close double quote

#### Part-of-Speech (POS) Tagging

- Words often have more than one POS:
  - The back door = JJ
  - On my back = NN
  - Win the voters back = RB
  - Promised to back the bill = VB

 POS tagging problem is to determine the POS tag for a particular instance of a word.

Source: adapted from Chris Manning

## Twitter-specific Tags

- #hashtag
- @metion
- url
- email address
- emoticon
- discourse marker
- symbols
- ...

Source: Gimpel et al.

### Notable Twitter POS Taggers

- Gimpel et al., 2011
- Ritter et al., 2011

- Derczynski et al, 2013
- Owoputi et al. 2013

## Chunking

Cant	VP
wait	VI
for	PP
the	
ravens	NP
game	
tomorrow	NP
go	VP
ray	NP
rice	INF
!!!!!!!	

## Chunking

- recovering phrases constructed by the part-of-speech tags
- a.k.a shallow (partial) parsing:
  - full parsing is expensive, and is not very robust
  - partial parsing can be much faster, more robust, yet sufficient for many applications
  - useful as input (features) for named entity recognition or full parser

#### Named Entity Recognition(NER)

#### [Recap] Classification Method:

### Supervised Machine Learning

Source: NLTK Book

#### [Recap] Classification Method:

### Supervised Machine Learning

- Input:
  - a document d
  - a fixed set of classes  $C = \{C_1, C_2, ..., C_j\}$
  - a training set of *m* hand-labeled documents (d1, C1), ..., (dm, Cm)

- Output:
  - a learned classifier  $\gamma$ :  $d \rightarrow c$

#### [Recap] Classification Method:

### Supervised Machine Learning

- Naïve Bayes
- Logistic Regression
- Support Vector Machines (SVM)

•

## [Recap] Naïve Bayes

#### Conditional Independence Assumption:

features P(ti|c) are independent given the class c

$$P(t_{1},t_{2},...,t_{n} | c)$$

$$= P(t_{1} | c) \cdot P(t_{2} | c) \cdot ... \cdot P(t_{n} | c)$$

Source: adapted from Dan jurafsky

## [Recap] Bag-of-Words

#### positional independence assumption:

- features are the words occurring in the document and their value is the number of occurrences
- word probabilities are position independent

#### Classification Method:

### Supervised Machine Learning

- Naïve Bayes
- Logistic Regression
- Support Vector Machines (SVM)
- •
- Hidden Markov Model (HMM)
- Conditional Random Fields (CRF)

•

sequential models

#### Classification Method:

#### Sequential Supervised Learning

- Input:
  - rather than just individual examples  $(w_1 = the, c_1 = DT)$
  - a training set consists of *m* sequences of labeled examples (X1, Y1), ..., (Xm, Ym)

 $x_1 = <the back door> and y_1 = <DT JJ NN>$ 

- Output:
  - a learned classifier to predict label sequences  $\gamma: x \to y$

#### Features for Sequential Tagging

- Words:
  - current words
  - previous/next word(s) context
- Other linguistic information:
  - word substrings
  - word shapes
  - POS tags
- Contextual Labels
  - previous (and perhaps next) labels

#### word shapes

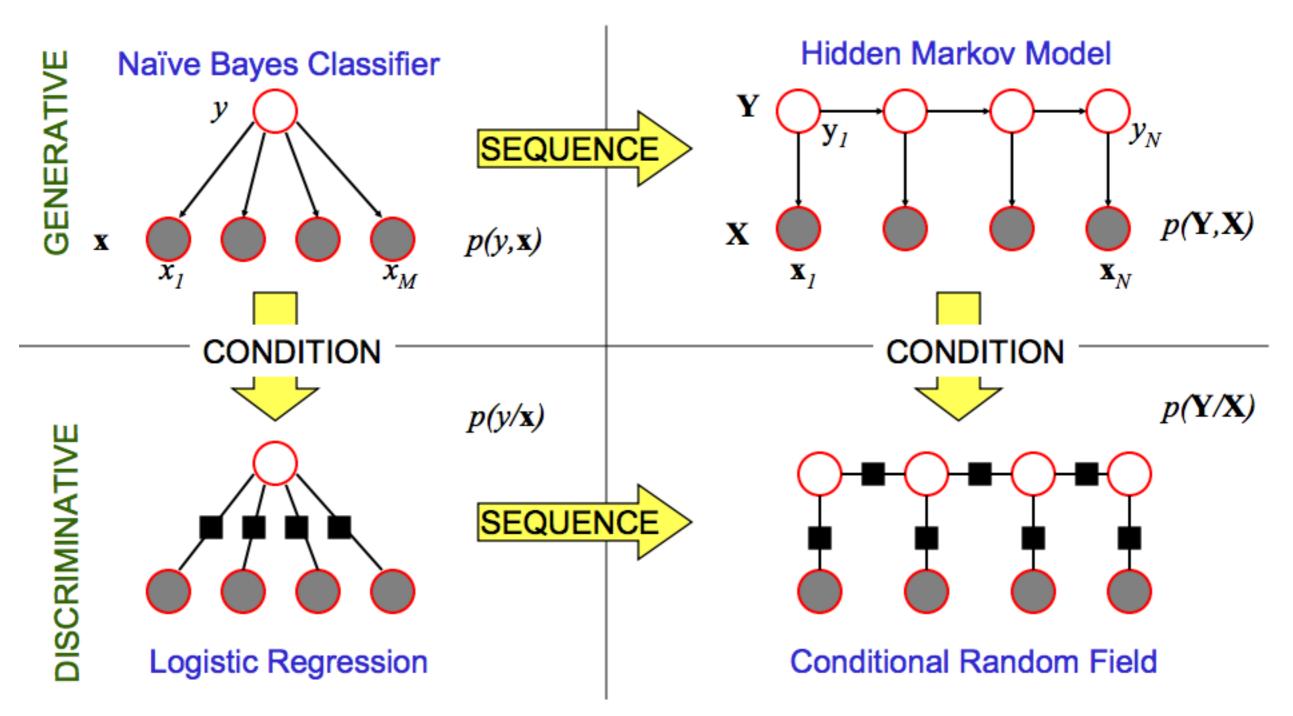

Varicella-zoster	Xx-xxx
mRNA	xxxx
CPA1	XXXd

#### Features for Sequential Tagging

- Words:
  - current words
  - previous/next word(s) context
- Other linguistic information:
  - word substrings
  - word shapes
  - POS tags
- Contextual Labels
  - previous (and perhaps next) labels

#### An Unsupervised Learning Method:

## Brown Clustering

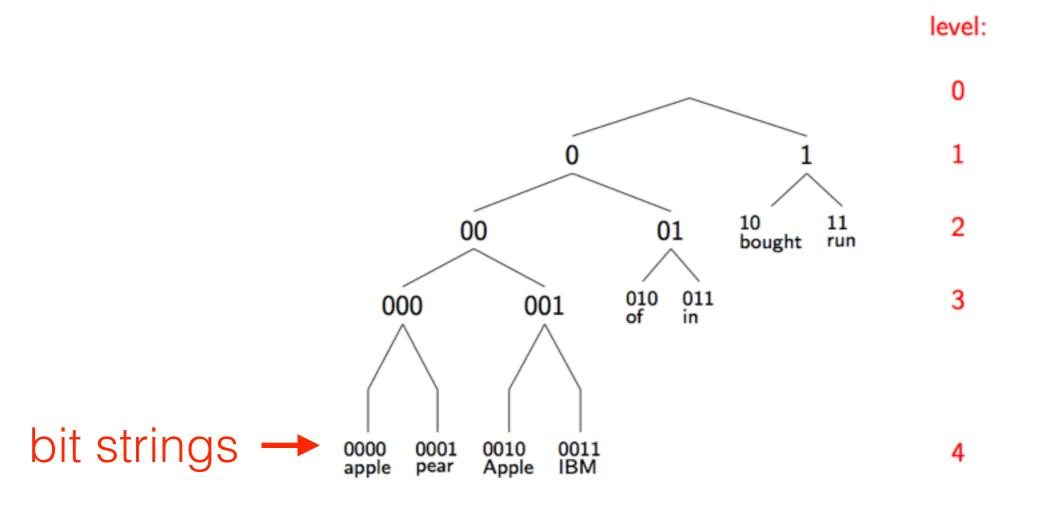

- Input:
  - a (large) corpus of documents

- Output:
  - 1. a partition of words into word clusters
  - 2. (generalization of 1) a hierarchical word clustering

• Example Clusters (from Brown et al. 1992)

Friday Monday Thursday Wednesday Tuesday Saturday Sunday weekends Sundays Saturdays June March July April January December October November September August people guys folks fellows CEOs chaps doubters commies unfortunates blokes down backwards ashore sideways southward northward overboard aloft downwards adrift water gas coal liquid acid sand carbon steam shale iron great big vast sudden mere sheer gigantic lifelong scant colossal man woman boy girl lawyer doctor guy farmer teacher citizen American Indian European Japanese German African Catholic Israeli Italian Arab pressure temperature permeability density porosity stress velocity viscosity gravity tension mother wife father son husband brother daughter sister boss uncle machine device controller processor CPU printer spindle subsystem compiler plotter John George James Bob Robert Paul William Jim David Mike anyone someone anybody somebody

word cluster features (bit string prefix)

- The Intuition:
  - similar words appear in similar contexts
  - more precisely:

similar words have similar distributions of words to their immediate left and right

 The algorithm — maximize the Quality function that score a given partitioning C:

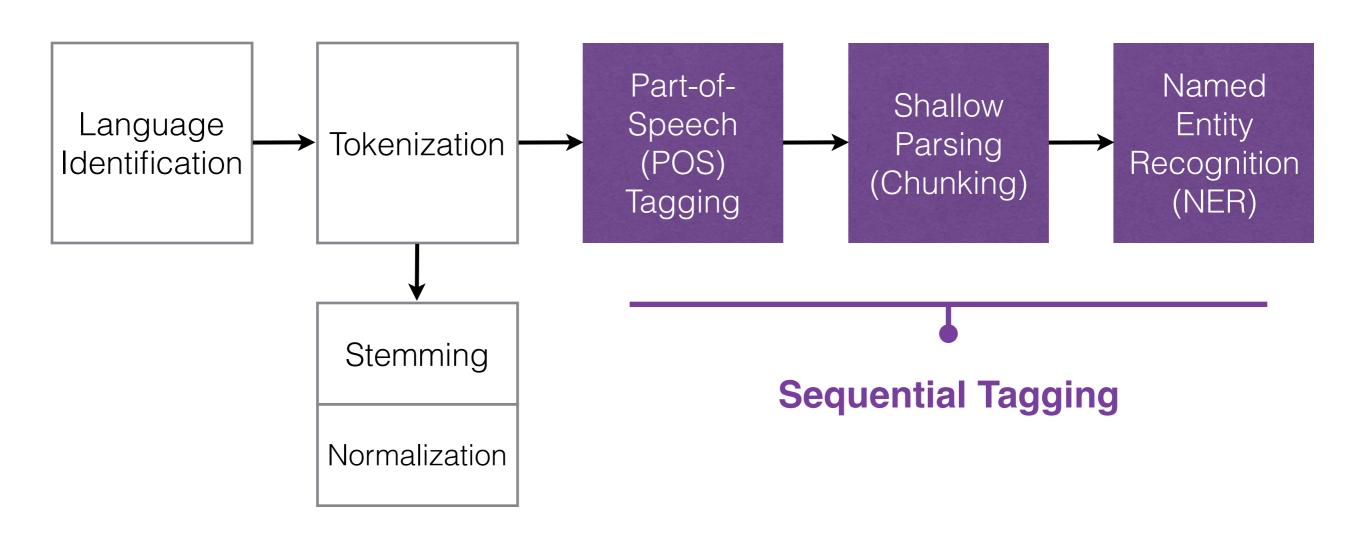

$$Quality(C) = \sum_{i=1}^{n} \log e(w_i | C(w_i)) q(C(w_i) | C(w_{i-1}))$$

$$= \sum_{c=1}^{k} \sum_{c'=1}^{k} p(c,c') \log \frac{p(c,c')}{p(c)p(c')} + G$$

- n(c):count of class c seen in the corpus
- n(c,c'): counts of c' seen following c

$$p(c,c') = \frac{n(c,c')}{\sum_{c,c'} n(c,c')} \qquad p(c,c') = \frac{n(c)}{\sum_{c} n(c)}$$

## Summary

### Thank You!
